

## Running the Proxy Server

Follow these steps:

- Run the proxy server program from a command prompt;
- Direct the traffic (requests) to the server using IP addresses and port numbers (e.g. `http://localhost:8888/www.google.com`)

To use the proxy server with browser and proxy on separate computers, you will need the IP address on which your proxy server is running. In this case, while running the proxy, you will have to replace the "localhost" with the IP address of the computer where the proxy server is running
