

Running The Server

Follow these steps:

- Put an HTML file (e.g., the provided hello.html) in the same directory that the server is in.
- Run the server program.
- Determine the IP address of the host that is running the server (e.g., 123.456.789.0).
- From another host, open a browser and provide the corresponding URL. For example: `http://123.456.789.0:1234/hello.html`

The port number after the colon (e.g. 12345) should be replaced by the port number used in the server code. The browser should then display the contents of hello.html. Trying to get a file that is not present at the server should paste a "404 Not Found" message.
